A time sharing system to provide development and quality assurance personnel a means of tracking the progress of software changes through the release cycle and to produce core image files for testing and release. The system consists of a command language, index sequential data base, assembler, binder and loader. The data base records those interrelations necessary to produce software systems from symbolic updates to source modules. It provides the developer a core image for testing that rep ...

DHTML and .NET: Host Secure, Lightweight Client-Side Controls in Microsoft Internet Explorer -- MSDN Magazine, January 2002

In the past, Web developers often used ActiveX controls if they wanted customized client-side functionality incorporated into their Web applications. Now, they can build objects supported by the Microsoft .NET Framework which are more compact, lightweight, secure, and seamlessly integrated. By hosting .NET Windows Forms controls in Internet Explorer, developers can realize many of their client-side Web development goals. This article adapts ActiveX concepts for use with Windows Forms, and builds a multiframe upload application that demonstrates these techniques.
